

Web2 Hackathon Problem Statement-2

CECB (Chhattisgarh Environment Conservation Board)

PS 02: Role Based Environmental Clearance System

Domain : Workflow Systems : Environmental Governance : GovTech

Background

The environmental clearance process involves multiple stakeholders, complex documentation, and manual meeting preparations.

To improve transparency, efficiency, and speed, the PARIVESH 3.0 initiative proposes a modern digital workflow system for managing environmental clearance applications and meeting documentation.

Problem Statement

Develop a unified web portal that manages the complete lifecycle of an environmental clearance application from initial filing by a project proponent to the final publication of the Minutes of the Meeting.

Core User Roles and Access Control

The system must implement strict role based access control managed by a central administrator.

Admin

- Secure login portal
- Dynamic role assignment between Scrutiny Team and MoM Team
- Provision master templates for meeting gist documents
- Manage sector specific parameters

Project Proponent or Recognized Qualified Professional

- User registration and profile management
- Selection of application category and industry sector
- Multi step application filing form

- Secure document upload engine
- Fee payment integration including QR code and UPI

Scrutiny Team

- Document verification and fee validation
- Flag deficiencies using Essential Document Sought
- Return applications for correction
- Refer verified applications for meetings
- Trigger automatic meeting gist generation

MoM Team

- Edit and refine generated meeting gist
- Convert gist into formal Minutes of Meeting
- Lock finalized MoM to prevent further editing

Technical Requirements

- Clean and modern web interface
- Document export in Microsoft Word and PDF formats
- Linear workflow status progression
- Strong data security and role isolation

Workflow Stages

- Draft
- Submitted
- Under Scrutiny
- Essential Document Sought
- Referred
- MoM Generated
- Finalized

Evaluation Criteria

- Workflow completeness
- UI quality
- Automation logic
- Payment integration
- Role based security implementation

Deliverables

- Functional web application prototype
- Source code repository
